

JobReady AI

PRODUCT DISCOVERY | Phase 1 — RICE Prioritisation

Turning a life-ending moment into a life-changing phase — through right guidance, awareness and information.

WHAT IS RICE & HOW WE ARE USING IT

R — REACH	How many users does this feature impact per month? Scored 1–10 relative to our user base.
I — IMPACT	How significantly does this move the needle for the user? Scored: Massive=3, High=2, Medium=1, Low=0.5, Minimal=0.25.
C — CONFIDENCE	How confident are we in our Reach and Impact estimates? Scored as a percentage: 100%, 80%, 50%.
E — EFFORT	How many person-weeks does this feature require to build? Lower effort = higher score. Scored 1–5 (1=hardest, 5=easiest).

$$\text{RICE Score} = (\text{Reach} \times \text{Impact} \times \text{Confidence}) \div \text{Effort}$$

SCORING RATIONALE — HOW WE ARRIVED AT EACH SCORE

All scores are grounded in Rahul's journey map and PRD. This is not a spreadsheet exercise — each number has a reason tied to a specific moment in the user's experience.

JD Ana

REACH	9 / 10		Every user hits this first. It is the entry point — the product's first value delivery. 9/10 users will use this in their first session.
IMPACT	Massive (3)		Solves the core diagnosis gap — the single biggest reason applications fail. Without this, every other feature is less effective.
CONFIDENCE	80%		High confidence on reach. Slight uncertainty on whether the fit score framing resonates — needs user testing to confirm.
EFFORT	3 / 5		Moderate effort. LLM prompt engineering for gap analysis is iterative. JD parsing and profile input form add complexity.
RICE SCORE	7.2		$(9 \times 3 \times 80\%) \div 3$

Mock I

REACH	7 / 10		Used by users who reach the interview stage. Not all users will get there in MVP window — but those who do have the highest stakes.
-------	--------	------------------------	---

IMPACT	High (2)		Directly addresses interview unpreparedness — Rahul's Week 5-6 pain. High impact at a critical moment. Slightly below JD Analyser as it is later in the journey.
CONFIDENCE	80%		Confident on reach and impact. LLM answer evaluation quality is the main variable — needs calibration during build.
EFFORT	2 / 5		Higher effort than others. Multi-turn conversation flow, STAR evaluation logic, session scoring and replay all require careful prompt engineering.
RICE SCORE 5.6 $(7 \times 2 \times 80\%) \div 2$			

Applica

REACH	8 / 10		All active job seekers need this. High reach — but it is a supporting tool, not the primary value driver in early sessions.
IMPACT	Medium (1)		Delivers visibility and structure — valuable but not transformative on its own. Its power compounds when combined with JD Analyser insights.
CONFIDENCE	100%		Fully confident. This is a well-understood data capture and display problem. No LLM dependency in MVP — deterministic output.
EFFORT	4 / 5		Relatively low effort. Structured data input, table display and CSV export are straightforward to build in Colab with Python.
RICE SCORE 2.0 $(8 \times 1 \times 100\%) \div 4$			

RICE SUMMARY & BUILD PRIORITY

PRIORITY	FEATURE	REACH	IMPACT	CONFIDENCE	EFFORT	RICE SCORE	BUILD ORDER
#1	JD Analyser	9/10	Massive (3)	80%	3/5	7.2	Sprint 1 — Week 1
#2	Mock Interview Engine	7/10	High (2)	80%	2/5	5.6	Sprint 1 — Week 2
#3	Application Tracker	8/10	Medium (1)	100%	4/5	2.0	Sprint 1 — Week 3

Key insight: JD Analyser builds first — it is the highest RICE score, the entry point of the product and the feature that makes every other feature more effective. Mock Interview Engine builds second — high stakes, high impact at a critical journey moment. Application Tracker builds third — lowest RICE but also lowest effort; it completes the MVP pipeline.
--

RICE is not the answer. It is a structured way to arrive at a defensible answer.
Every score here traces back to Rahul's journey. That is what separates prioritisation from guesswork.
