

JobReady AI

PRODUCT DISCOVERY | Phase 1 — Success Metrics

Turning a life-ending moment into a life-changing phase — through right guidance, awareness and information.

NORTH STAR METRIC

% of users who move from unstructured applying to interview stage within 4 weeks of using JobReady AI

This metric captures the core hypothesis: that the right guidance turns paralysis into progress. It is not just about logins or clicks — it measures a real outcome in Rahul's life. MVP target: **40% of beta users reach interview stage within 4 weeks.**

FEATURE-LEVEL SUCCESS METRICS

CATEGORY	METRIC	DEFINITION	TARGET	WHY IT MATTERS
JD Analyser	Fit Score Usage	User runs JD Analyser on at least 1 JD per week	>70% of active users	Signals the product is being used for targeting, not just onboarding curiosity
JD Analyser	Gap Action Rate	User takes at least 1 recommended action from gap analysis	>50% of sessions	Measures whether analysis converts to behaviour change — the real goal
JD Analyser	Callback Improvement	Application-to-callback rate after using JD Analyser vs before	From <5% to >20%	The ultimate proof that targeted applying works better than volume applying
App Tracker	Pipeline Fill Rate	% of applications logged vs total applications sent by user	>80% logged	If Rahul is not logging, the tracker has no value — adoption is the first gate
App Tracker	Stale Flag Action	User takes action on a stale application within 48hrs of flag	>60% action rate	Measures whether visibility converts to follow-through — not just awareness
App Tracker	Pipeline Visibility	User can state how many active applications they have at any time	100% accuracy on ask	If Rahul knows his pipeline, the chaos is gone — this is the core value
Mock Engine	Session Completion	User completes a full 10-question session without dropping off	>65% completion rate	Mock interviews are uncomfortable — completion signals the product earns trust
Mock Engine	Score Improvement	Session score improves by at least 10 points across 3 sessions	>60% of repeat users	Proves the engine is teaching, not just testing
Mock Engine	Pre-Interview Usage	User runs at least 1 session within 48hrs before a real interview	>50% of interview callbacks	If Rahul uses this before interviews, it is embedded in his workflow
Product	Week 2 Retention	User returns and takes action in Week 2 after onboarding	>55% retention	Week 1 is curiosity. Week 2 is belief. This is the trust threshold.
Product	NPS	Net Promoter Score from beta users in target persona	NPS > 60	Would Rahul recommend this to a peer in the same situation? That is the test.

Product	Emotional Outcome	User self-reports feeling 'more in control' after 2 weeks	>70% positive response	JobReady AI's mission is emotional as much as functional — this measures it
---------	-------------------	---	------------------------	---

WHAT WE ARE NOT MEASURING IN MVP — AND WHY

Daily Active Users (DAU)	Job searching is not a daily habit — it is an intense burst activity. DAU would penalise the product for being used correctly.
Time on platform	We want Rahul to take action and leave — not stay longer. More time on platform is not a signal of value here.
Total applications sent	Volume is the problem we are solving, not the goal. Measuring this would reward the wrong behaviour.
Revenue / conversion	MVP is pre-monetisation. Adding revenue pressure at this stage would distort product decisions.

Metrics exist to tell the truth — not to confirm what we want to believe.
If Rahul is getting callbacks, completing sessions and feeling more in control — the product is working.
Everything else is a leading indicator of that.
